Lecture 16 - 2) Use the recurrence relations

$$(2n+1)xP_n(x) = (n+1)P_{n+1}(x) + nP_{n-1}(x)$$
(1)

and

$$P'_{n+1}(x) + P'_{n-1}(x) = 2xP'_n(x) + P_n(x)$$
(2)

to show that

$$P'_{n+1}(x) - P'_{n-1}(x) = (2n+1)P_n(x). (3)$$

Let us differentiate Eq. (1):

$$(2n+1)P_n(x) + (2n+1)xP'_n(x) = (n+1)P'_{n+1}(x) + nP'_{n-1}(x).$$
(4)

From Eq. (2), we see that

$$2xP'_n(x) = P'_{n+1}(x) + P'_{n-1}(x) - P_n(x).$$
(5)

Hence, Eq. (4) becomess

$$2(2n+1)P_{n}(x) + (2n+1)[P'_{n+1}(x) + P'_{n-1}(x) - P_{n}(x)] = 2(n+1)P'_{n+1}(x) + 2nP'_{n-1}(x)$$

$$[(2n+1) - (2n+2)]P'_{n+1}(x) + [(2n+1) - 2n]P'_{n-1}(x) = -[(4n+2) - (2n+1)]P_{n}(x)$$

$$-P'_{n+1}(x) + P'_{n-1}(x) = -(2n+1)P_{n}(x)$$

$$P'_{n+1}(x) - P'_{n-1}(x) = (2n+1)P_{n}(x)$$
(6)

Lecture 16 - 3) Show that

$$g(x,t) = \frac{1}{\sqrt{1 - 2xt + t^2}}\tag{7}$$

satisfies the differential equation

$$\frac{\partial}{\partial x} \left[ (1 - x^2) \frac{\partial}{\partial x} g(x, t) \right] + t \frac{\partial^2}{\partial t^2} \left[ t g(x, t) \right] = 0.$$
 (8)

For this problem, we simply take derivatives:

$$\frac{\partial g}{\partial x} = \frac{t}{(1 - 2xt + t^2)^{3/2}}\tag{9}$$

$$\frac{\partial}{\partial x} (1 - x^2) \frac{\partial g}{\partial x} = -\frac{t(2t^2x - tx^2 - 3t + 2x)}{(1 - 2xt + t^2)^{5/2}}$$
(10)

$$t\frac{\partial^{2}(tg)}{\partial t^{2}} = t\frac{\partial}{\partial t} \left[ \frac{1 - xt}{(1 - 2xt + t^{2})^{3/2}} \right]$$
$$= \frac{t(2t^{2}x - tx^{2} - 3t + 2x)}{(1 - 2xt + t^{2})^{5/2}}.$$
 (11)

Clearly, the expressions in Eq. (10) and Eq. (11) match up to a minus sign, so g(x,t) satisfies the differential equation given by Eq. (8).

## Lecture 17 - 1) Check that

$$\langle Au, v \rangle = \langle u, Av \rangle \iff p(x) \left[ u'v - uv' \right] \Big|_a^b = 0.$$
 (12)

The inner product on  $L_{2,w}(a,b)$  (where w(x) > 0 for all  $x \in (a,b)$ )

$$\langle u, v \rangle = \int_a^b w(x)u(x)v(x) dx,$$
 (13)

and the operator A is defined such that

$$Au = -\frac{1}{w(x)} \Big[ \partial_x \big( p(x) \partial_x u \big) + q(x) u \Big], \tag{14}$$

where p(x) > 0 and q(x) is a real-valued function on (a, b).

Assuming that  $\langle Au, v \rangle = \langle u, Av \rangle$  holds, then

$$\int_{a}^{b} \left[ \partial_{x} \left( p(x) \partial_{x} u(x) \right) + q(x) u(x) \right] v(x) \, \mathrm{d}x = \int_{a}^{b} u(x) \left[ \partial_{x} \left( p(x) \partial_{x} v(x) \right) + q(x) v(x) \right] \, \mathrm{d}x \,, \quad (15)$$

where w(x) vanishes here since it is strictly positive. Simplifying, we find

$$\int_{a}^{b} \left[ p'u'v + pu''v - up'v' - upv'' \right] dx = 0.$$
 (16)

We can now integrate by parts on the terms containing derivatives of p(x) such that

$$pu'v|_a^b - upv'|_a^b + \int_a^b \left[ p\partial_x(u'v) + pu''v - p\partial_x(uv') - upv'' \right] dx = 0.$$
 (17)

Upon taking derivatives and simplifying, we realize that the integrand in the second term is identically zero, leaving us with

$$p(x)[u'(x)v(x) - u(x)v'(x)]\Big|_a^b = 0.$$
(18)

Now we assume that Eq. (18) holds true. Thus,

$$\langle Au, v \rangle = \int_{a}^{b} \left[ \partial_{x} \left( p(x) \partial_{x} u(x) \right) + q(x) u(x) \right] v(x) \, \mathrm{d}x$$

$$= \int_{a}^{b} \left[ p'u'v + pu''v + qvu \right] \, \mathrm{d}x$$

$$= pu'v|_{a}^{b} + \int_{a}^{b} \left[ -pu''v - pu'v' + pu''v + qvu \right] \, \mathrm{d}x$$

$$= pu'v|_{a}^{b} - puv'|_{a}^{b} + \int_{a}^{b} \left[ p'v' + pv'' + qvu \right] \, \mathrm{d}x$$

$$= \langle u, Av \rangle, \tag{20}$$

which concludes the second portion of the proof, showing a necessary and sufficient condition for operator A to be symmetric.

**Lecture 17 - 2)** Check that for operator A given by Eq. (14)

$$\langle Au, u \rangle = -p(x)u'u|_a^b + \int_a^b [p(x)|u'(x)|^2 - q(x)|u|^2] dx.$$
 (21)

We can steal the form of Eq. (19) and substitute v = u, which gives us that

$$\langle Au, u \rangle = p(x)u'(x)u(x)\big|_a^b - \int_a^b \left[ p(x)|u'(x)|^2 - q(x)|u(x)|^2 \right] dx$$
 (22)

**Lecture 17 - 3)** For all  $u, v \in C^2(\overline{\Omega})$ , where  $\overline{\Omega} = \Omega \cup \partial \Omega$  ( $\Omega$  is bounded), check the so-called Green's identities

$$\langle Au, v \rangle - \langle u, Av \rangle = \int_{\Omega} p \left( u \frac{\partial v}{\partial n} - v \frac{\partial u}{\partial n} \right) dS,$$
 (23)

where  $\partial_n = \hat{n} \cdot \nabla$  is the directional derivative along the direction normal to the surface of  $\Omega$ , where  $\hat{n}$  is the normal vector to  $\partial\Omega$ ,

$$\langle Au, u \rangle = -\int_{\partial\Omega} pu \frac{\partial u}{\partial n} \, dS + \int_{\Omega} \left[ p |\nabla u|^2 - q|u|^2 \right] d^3x \,. \tag{24}$$

Hint for 
$$Ex, 3. \nabla \cdot (p \nabla u) V = \sum_{j} \partial_{j} (p \partial_{j} u) V =$$

$$= \sum_{j} \partial_{j} (p \nabla \partial_{j} u) - \sum_{j} p \partial_{j} \nabla \partial_{j} u = \nabla \cdot (p \nabla \nabla u) -$$

$$- p \nabla V \cdot \nabla u = \nabla \cdot (p \nabla \nabla u) - p \nabla u \cdot \nabla V$$

The multi-dimensional operator A is defined in analogy with the one-dimensional version such that

$$Au = -\frac{1}{w(x)} \Big[ \nabla \cdot (p\nabla u) + qu \Big], \tag{25}$$

and the inner product is defined in analogy with the one-dimensional version as

$$\langle u, v \rangle \int_{\Omega} w(x)u(x)v(x) d^3x$$
 (26)

Checking the first identity is quite simple then:

$$\langle Au, v \rangle - \langle u, Av \rangle = \int_{\Omega} \left[ v \nabla \cdot (p \nabla u) - u \nabla \cdot (p \nabla v) \right] d^3x \tag{27}$$

$$= \int_{\Omega} \left[ \left( \nabla \cdot (pv\nabla u) - p\nabla u \cdot \nabla v \right) - \left( \nabla \cdot (pu\nabla v) - p\nabla v \cdot \nabla u \right) \right] d^3x \quad (28)$$

$$= \int_{\Omega} \nabla \cdot p \left[ u \nabla v - v \nabla u \right] d^3 x = \int_{\partial \Omega} p \left( u \frac{\partial v}{\partial n} - v \frac{\partial u}{\partial n} \right) dS \quad . \tag{29}$$

For the second, we follow a similar sequence of work:

$$\langle Au, u \rangle = -\int_{\Omega} \left[ \nabla \cdot pu \nabla u - p \nabla u \cdot \nabla u + q|u|^2 \right] d^3x$$
 (30)

$$= \int_{\partial\Omega} pu \frac{\partial u}{\partial n} dS + \int_{\Omega} \left[ p|\nabla u|^2 - q|u|^2 \right] d^3x \qquad (31)$$

**Lecture 17 - 4)** Find eigenvectors and eigenvalues for operator A, defined such that  $Au = -\Delta u$  (defined in Example 2) in the following cases.

For the Laplace operator we have the eigenfunctions as  $e_{nm}(x,y) = e_n(x)e_m(y)$  with corresponding eigenvalues  $\lambda_{mn} = \lambda_m + \lambda_n$ .

4.1) 
$$\mathcal{D}(A) = \{ u \in C^2(\overline{\Omega}) : u(x,0) = u(x,H) = 0, u_x(0,y) = u_x(L,y) = 0 \}$$

For these boundary conditions we have  $e_n(x) = \cos(n\pi x/L)$  ( $\lambda_n = (n\pi/L)^2$ ) for n = 0, 1, ..., and  $e_m(y) = \sin(n\pi y/H)$  ( $\lambda_m = (m\pi/H)^2$ ) for m = 1, 2, ...

4.2) 
$$\mathcal{D}(A) = \{u \in C^2(\overline{\Omega}) : u(0,y) = u(L,y), u_x(0,y) = u_x(L,y), u(x,0) = u(x,L), u_y(x,0) = u_y(x,H)\}$$

The periodic boundary conditions for for x are  $e_n(0) = e_n(L)$  and  $e'_n(0) = e'_n(L)$ , which gives eigenfunctions  $e_0(x) = 1$  ( $\lambda_0 = 0$ ),  $e_n(x) = \cos(n\pi x/L)$  and  $\sin(n\pi x/L)$  ( $\lambda_n = (n\pi/L)^2$ ) for  $n \ge 1$ . Similarly, the eigenfunctions  $e_m(y)$  are  $e_0(y) = 1$  ( $\lambda_0 = 0$ ) and  $e_m(y) = \cos(m\pi y/H)$  and  $\sin(m\pi y/H)$  ( $\lambda_m = (m\pi/H)^2$ ) for  $m \ge 1$ .
