Lecture 1

1) Estimate

$$\left| \frac{u(t+h) - u(t-h)}{2h} - u'(t) \right| \le ?. \tag{1}$$

for h > 0 and $|\partial^3 u(s)| \le m$, $s \in [t - h, t + h]$.

We have the expression

$$u(t+h) = u(t) + hu'(t) + \frac{h^2}{2}u''(t) + \int_t^{t+h} \frac{(t+h-s)^2}{2}u^{(3)}(s) \, ds.$$
 (2)

Taking $h \to -h$, Eq. (2) becomes

$$u(t-h) = u(t) - hu'(t) + \frac{h^2}{2}u''(t) - \int_{t-h}^{t} \frac{(t-h-s)^2}{2}u^{(3)}(s) \, ds.$$
 (3)

Subtracting the two we get

$$u(t+h) - u(t-h) = 2hu'(t) + \left(\int_{t}^{t+h} \frac{(t+h-s)^{2}}{2} u^{(3)}(s) ds - \int_{t-h}^{t} \frac{(t-h-s)^{2}}{2} u^{(3)}(s) ds \right).$$

$$(4)$$

Thus,

$$\left| \frac{u(t+h) - u(t-h)}{2h} - u'(t) \right| = \frac{1}{2h} \left| \int_{t}^{t+h} \frac{(t+h-s)^{2}}{2} u^{(3)}(s) \, ds \right| - \int_{t-h}^{t} \frac{(t-h-s)^{2}}{2} u^{(3)}(s) \, ds \right|.$$
 (5)

Using $|a \pm b| \le |a| + |b|$, $|\int f(x) dx| \le \int |f(x)| dx$, and the condition $|u^{(3)}| \le m$, we can write

$$\left| \frac{u(t+h) - u(t-h)}{2h} - u'(t) \right| \le \frac{m}{4h} \left[\int_{t}^{t+h} (t+h-s)^{2} ds + \int_{t-h}^{t} (t-h-s)^{2} ds \right]$$

$$= \frac{m}{4h} \left(\frac{h^{3}}{3} + \frac{h^{3}}{3} \right) = \boxed{\frac{mh^{2}}{6}}.$$
(6)

2) Let there be positive numbers c,M such that for all $N\in\mathbb{Z}_{\geq 0}$

$$|\partial^N u(s)| \le cM^N N!, \qquad |s - a| \le |t - a|. \tag{7}$$

Using

$$u(t) = \sum_{n=0}^{N-1} \frac{(t-a)^n}{n!} \partial^n u(a) + \int_a^t \frac{(t-s)^{N-1}}{(N-1)!} \partial^N u(s) \, \mathrm{d}s, \tag{8}$$

show that

$$\left| u(t) - \sum_{n=0}^{N-1} \frac{(t-a)^n}{n!} \partial^n u(a) \right| \le c(M|t-a|)^N \to 0$$
 (9)

if M|t-a| < 1. In this case we obtain Taylor's series for function u.

From Eq. (8) we have (assuming t > a)

$$\left| u(t) - \sum_{n=0}^{N-1} \frac{(t-a)^n}{n!} \partial^n u(a) \right| = \left| \int_a^t \frac{(t-s)^{N-1}}{(N-1)!} \partial^N u(s) \, \mathrm{d}s \right|$$

$$\leq \frac{cM^N N!}{(N-1)!} \int_a^t |t-s|^{N-1} \, \mathrm{d}s$$

$$= cNM^N \frac{(t-s)^N}{N} \Big|_a^t$$

$$= cM^N [-(a-s)^N]$$

$$= \left| c \left[M|t-a| \right]^N \right]. \tag{10}$$

Note that the argument is similar for t < a. We get a relative – sign from switching the bounds of integration and another from having t < s such that |t - s| = -(t - s). These minus signs cancel giving us the result in Eq. (10).

If M|t-a| < 1, then in the limit $N \to \infty$, we have $c[M|t-a|]^N \to 0$.

3) Let there be positive numbers c, M such that for all $N \in \mathbb{Z}_{\geq 0}$

$$|\partial^N u(s)| \le cM^N (N!)^{\alpha}, \qquad \alpha < 1, \quad s \in \mathbb{R}.$$
 (11)

Show that in this case we have convergent Taylor series for all $t, a \in \mathbb{R}$.

Note that

$$|\partial^N u(s)| \le cM^N (N!)^\alpha = \frac{cM^N N!}{(N!)^{1-\alpha}}.$$
(12)

Thus, we can alter Eq. (10) to read

$$\left| u(t) - \sum_{n=0}^{N-1} \frac{(t-a)^n}{n!} \partial^n u(a) \right| \le \frac{c[M|t-a|]^N}{(N!)^{1-\alpha}} \to 0, \quad \text{as } N \to \infty,$$
 (13)

noting that factorials grow faster than powers of N.

Lecture 2

1) Check that

$$v(t) = \int_0^t \frac{\sin[(t-\tau)\sqrt{A}]}{\sqrt{A}} f(\tau) d\tau.$$
 (14)

satisfies $v(0) = \partial_t v(0) = 0$ and $(\partial_t^2 + A)v = f(t)$ for t > 0.

It is clear that v(0) = 0 since the upper bound is the same as the lower bound at t = 0. Next,

$$\partial_t v(t) = \frac{\sin\left[(t-\tau)\sqrt{A}\right]}{\sqrt{A}} f(\tau) \bigg|_{\tau=t} + \int_0^t \partial_t \left(\frac{\sin\left[(t-\tau)\sqrt{A}\right]}{\sqrt{A}}\right) f(\tau) d\tau$$
$$= \int_0^t \cos\left[(t-\tau)\sqrt{A}\right] f(\tau) d\tau \Rightarrow \boxed{\partial_t v(0) = 0}. \tag{15}$$

Finally,

$$\partial_t^2 v(t) = \partial_t \int_0^t \cos\left[(t - \tau)\sqrt{A}\right] f(\tau) d\tau$$

$$= f(\tau) - \int_0^t \sqrt{A} \sin\left[(t - \tau)\sqrt{A}\right] f(\tau) d\tau$$

$$= f(\tau) - Av(t)$$

$$\Rightarrow \boxed{(\partial_t^2 - A)v(t) = f(\tau)}$$
(16)

2) Check

$$u(t) = \frac{\sin\left[(T-t)\sqrt{A}\right]}{\sin\left(T\sqrt{A}\right)}g + \frac{\sin\left(t\sqrt{A}\right)}{\sin\left(T\sqrt{A}\right)}\left[h - \int_0^T \frac{\sin\left[(T-\tau)\sqrt{A}\right]}{\sqrt{A}}f(\tau) d\tau\right] + \int_0^t \frac{\sin\left[(t-\tau)\sqrt{A}\right]}{\sqrt{A}}f(\tau) d\tau.$$
(17)

satisfies the boundary conditions u(0) = g and u(T) = h.

First, we check at t = 0:

$$u(0) = \frac{\sin(T\sqrt{A})}{\sin(T\sqrt{A})}g = g. \tag{18}$$

Next, we check at t = T:

$$u(T) = h - \int_0^T \frac{\sin[(T-\tau)\sqrt{A}]}{\sqrt{A}} f(\tau) d\tau + \int_0^T \frac{\sin[(T-\tau)\sqrt{A}]}{\sqrt{A}} f(\tau) d\tau = h.$$
 (19)
